Notes

- Walked through sections on authentication, attribute freshness and technical and organizational security: https://docs.google.com/document/d/15v65wJvRwTSQKViep_gGuEvxLl3UJbaOX5o9eLtsyBI/edit

- good password practices?
  - entropy requirements for passwords getting more demanding every year. Instead of fixing it in the spec we should refer to an body that specifies what is currently good enough
  - what would be the body to define the current entropy requirements? REFEDS? We can propose that.

- approach to Authentication section
  1. good enough for organisational's internal systems
     - we need to define what they are
     - e.g. Administrational systems dealing with money (), personal data (HR), student information
  2. kantara AL2: password authentication with entropy requirements
  3. multifactor authentication

- freshness of ePAffiliation
  - clarify that freshness here means the latency of the idm system to reflect the affiliation change in the institutional systems
  - think of complementing qualitative requirements (e.g. is a person qualifies as a ePA=faculty there must be an employment contract or other contract in place)

- data protection
  - how to make sure Home Organisations are willing to release eduPersonAffiliation attribute (or similar)

- proper references
  - In the LoA wireframe, refer to proper versions of the underlying specifications

- next meeting: every 2 weeks at this time, starting on Oct 3?
  - after the meeting it was proposed to start 30 mins earlier
